## Current State Risk Assessment Challenges

### Current State

- **Point in time** review that is updated only periodically (eg annually)

- **Qualitative and subjective input** based on outdated assumptions

- **Limited by organizational silos** with challenges assessing themes spanning across the company

### “Analytics Enablers”

Automation and real-time reporting

Key risk indicators (KRIs) based on actual data

More robust data infrastructure based on modern tools and technologies

### Future State

- **Live risk analysis** and reporting tools to enable a continuous assessment of risk and identification of emerging risk areas

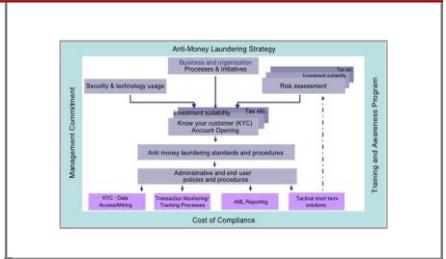

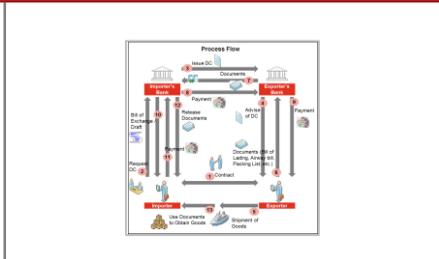

- **Strong quantitative evidence** to support and confirm the qualitative analysis included in the assessment

- **Centralized analysis and reporting** to be able to quickly understand thematic risks across the organization

**Analytics is a key enabler to improving each of these key risk assessment characteristics**

# Assessing Risk and Data Analytics

## 1. Define Structure and Taxonomy

The organization can be categorically dissected and analyzed so that risk assessments can be conducted in a standardized manner.

## 2. Identify Key Risk Factors

Quantitative analytics of risk factors through KRIs allow for automation and continuous monitoring. A good KRI should be measurable, comparable, and provide insight specific to the risk factor.

### Bad KRIs

1. # of Wire Originators
2. Total # of Wires
3. Total # of Foreign Wires
4. Total # Customers

### Good KRIs

1. Percentage of wires to high risk customers
2. Value of wires to tax havens
3. Cash by customer and segment type
4. Drafts by Customer and segment type

## 3. Evaluate Inherent Risk

Risk measurements can be benchmarked, visualized, and analyzed using data analytics tools to supplement the risk based assessment of the organization's inherent risks.

## 4. Assess Current Controls

Key Performance Indicators can be used to quantify the success of the organization's risk mitigating controls and identify pain points.

## 5. Evaluate Residual Risks

The quantifiable measurements of the risk assessment process can be viewed holistically to determine the residual risks despite the controls in place.

## 6. Report Key Risk Trends

The results of the risk assessment can be analyzed and stored over time for trend analysis and a longer term projection of compliance programs.

## Analytics Focus Areas

Exploratory Analysis

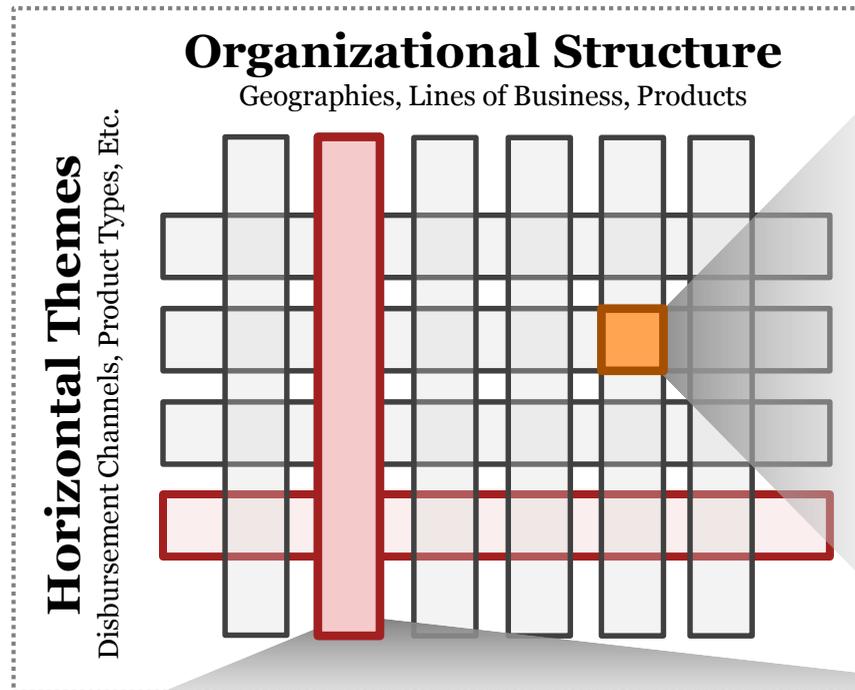

Defining Key Risk Indicators (KRIs)

Real-time Reporting and Dashboarding

Trending and Thematic Analysis

## Getting the KRIs Right

### Risk Assessment Taxonomy

### Intersectional KRIs

#### Inherent Risk

- Wire volume and value to tax havens
- ...

#### Controls KRIs

- Alert productivity of “High Risk Wire” detection scenario
- ...

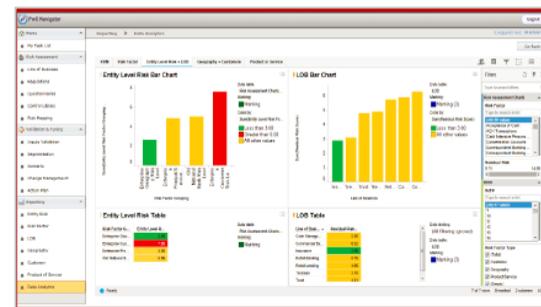

**By generating and evaluating KRIs within the intersections of the organizational structure and horizontal risk themes, risk can be stratified for varying cross-sections of the organization**

## Where to Start: Leveraging Existing Analytics and Data

***Analytics are being developed across the bank. The Risk Assessment should leverage existing analytics and data to support risk analysis to the extent possible***

---

## *How to Expand: Areas of Focus*

### **1 Build a Data-Driven Culture**

---

- Mandate that assessments be based on quantitative evidence and hard facts
- Empower and encourage staff to use available tools and technologies

### **3 Start with Visualization**

---

- Visualization tools are light-weight entry points into Data Analytics with highest ROI

### **5 Focus on High Risk Areas First**

---

- Prioritize efforts to improve analytics around higher risk areas

### **2 Standardize and Centralize KRIs**

---

- Maintain common utility or team for KRI generation and evaluation to confirm data quality, accuracy, and completeness

### **4 Leverage Existing Infrastructure**

---

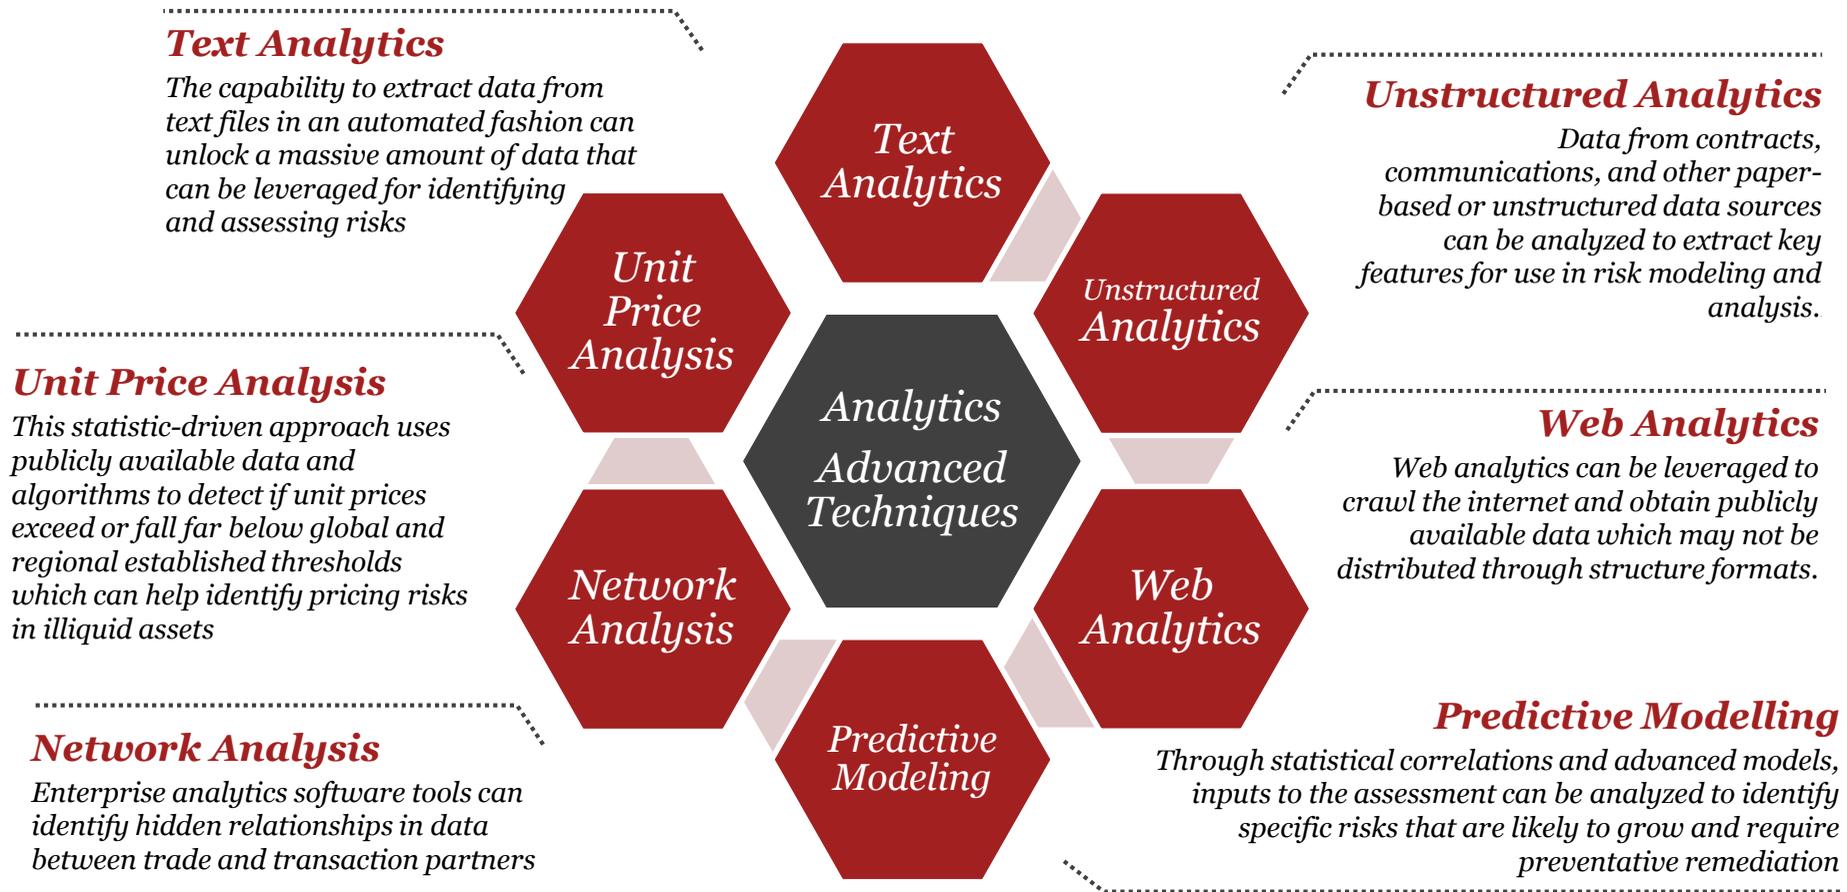

- Compliance functions have led the consolidation and aggregation of data across the enterprise
- Don't reinvent the wheel!

### **6 Operationalize Analysis**

---

- Analytics should be developed with an aim to distribute the work products to stakeholders across the enterprise for broader use

## ***Key Takeaways***

**1**

The importance of effective risk assessment and risk management increases as money laundering risks become more complex, the organization evolves, and perpetrators become more sophisticated

**2**

Data analytics is a key enabler to driving the improvements required of the risk assessment, including depth of analysis, frequency of delivery, and adaptability to changing internal and external factors

**3**

Deployment of data analytics is a journey, and the bank should pursue the growth and maturity of data analytics application using a risk-based approach focused on the areas of greatest value
